

SAJID ANSARI

Software Engineer | Java, Spring Boot, Microservices

sajidansari307@gmail.com | +91 7981171017 | Hyderabad, Telangana, India | linkedin.com/in/sajidansari307

SUMMARY

Software Engineer with 4+ years of experience building scalable, event-driven backend systems using Java, Spring Boot, Spring WebFlux, and Microservices. Delivers high-throughput RESTful APIs and asynchronous messaging pipelines (Kafka, RabbitMQ) for enterprise-scale production workloads, with hands-on experience in legacy modernization, PostgreSQL/MySQL performance tuning, containerized deployments (Docker, Kubernetes), and observability (Splunk, Prometheus). Experienced with AWS cloud services and applied AI integration (Gemini API). Owns end-to-end delivery of complex backend systems and is ready to take on senior-level scope.

TECHNICAL SKILLS

- Languages:** Java 8/17, SQL
- Frameworks:** Spring Boot, Spring MVC, Spring WebFlux, Spring Data JPA, Hibernate
- Architecture:** Microservices, RESTful APIs, Reactive Programming, Event-Driven Architecture, Distributed Systems, System Design
- Messaging:** Apache Kafka, RabbitMQ
- Databases:** PostgreSQL, MySQL
- Cloud & DevOps:** AWS (S3), Docker, Kubernetes, Git, Maven, CI/CD
- Monitoring & Observability:** Splunk, Prometheus
- AI Integration:** Google Gemini API
- Practices:** Agile Scrum, SOLID Principles, Design Patterns, Code Reviews, Production Support, Unit Testing

EXPERIENCE

- Software Engineer — Cognizant Technology Solutions

Jan 2025 – Present

Sentinels — enterprise modernization, legacy Vaadin to Vue.js/Spring Boot

 - Architected and built a new Spring Boot REST API layer from scratch — 80+ endpoints across 9 product domains — serving as the backend foundation for a full platform re-architecture, backed by 400+ unit and integration tests.
 - Designed a model organization feature end-to-end, spanning schema changes, a drag-and-drop reorder API, and fallback assignment logic from the database layer through the service layer.
 - Eliminated N+1 query patterns across backend services by replacing per-row updates with bulk SQL, database-level ordering, and aggregate queries, removing bottlenecks that caused visible user-facing delays.
 - Proactively identified and resolved critical pre-production risks, including cross-module Spring Session conflicts between coexisting legacy and modern modules, Hibernate discriminator mismatches, and a silent field-drop bug causing downstream validation failures.
 - Wired SSO into Spring Security and delivered idle-session logout with configurable timeout and full audit trail, replacing a legacy third-party authentication mechanism.
 - Delivered async post-save data flush, cross-tab cache invalidation, and cross-user real-time notifications, maintaining data consistency without blocking the request thread.
 - Designed a phased migration strategy letting the legacy Vaadin application and new Vue.js/Spring Boot architecture coexist without disrupting production users, and containerized the new services on Kubernetes with CI/CD pipeline support.
 - Collaborated cross-functionally to deliver migration milestones on schedule while ensuring zero disruption to business continuity.
 - Strengthened production observability via centralized logging and monitoring (Splunk, Prometheus), and maintained test/dependency-injection wiring integrity across controllers, consistently meeting review standards across 100+ pull requests.
- Junior Software Engineer — Cognizant Technology Solutions

Jun 2023 – Dec 2024

Intelligent Routing Application — AI-assisted contact center routing platform

 - Designed an event consumer processing 500+ real-time events per minute from Genesys Dispatcher with zero data loss.

- Diagnosed and fixed a **request cross-contamination bug** in a high-concurrency correlation store, where a shared-resource-based key let concurrent requests overwrite each other's futures — switching to a composite request-scoped key cut failure rate under concurrent same-resource load from ~100% to 0% and bounded P99 latency.
- Fixed a **cascade failure** caused by an overly broad cache-clear call that wiped every in-flight request on a single anomalous event, scoping cleanup to the originating request and reducing blast radius from a full-concurrency outage to exactly one request.
- Identified and corrected an **incorrect reactive operator** (`doOnNext` instead of `flatMap`) that broke sequential step ordering in a multi-step pipeline, eliminating race conditions between dependent steps.
- Replaced a per-call **WebSocket connection model** with a Kafka-based async request-response pattern, removing handshake latency and decoupling requests from mid-call auth token expiry.
- Closed an **idempotency gap** in event-driven processing by adding a cache-first pre-check before reprocessing duplicate Kafka deliveries, eliminating redundant writes and correcting inflated real-time statistics.
- Operated in a fast-paced **Agile R&D environment** with rapidly evolving business requirements.

Program Analyst — Cognizant Technology Solutions

Aug 2022 – May 2023

Media Manager — enterprise platform for IVR multimedia assets

- Built a **chunking pipeline** to work around a hard per-request size limit on a third-party speech recognition API — splitting oversized audio files into fixed-duration segments by stream metadata, processing them concurrently, and reassembling transcripts in original order.
- Implemented the fix for a **threading model conflict** between a blocking, stateful WebSocket-based recognition service and the app's non-blocking Reactor/Netty runtime, offloading blocking calls to a bounded elastic thread pool and bridging async callbacks via `CountDownLatch`, with a 300-second timeout safeguard against silent hangs.
- Contributed to redesigning file distribution to 100+ downstream servers across multiple regions, moving from push to pull delivery so each server self-schedules polls against a per-server sequence cursor and receives only its delta as a streamed ZIP.
- Refactored a **blocking database call** into a non-blocking reactive `flatMap` chain, removing a hidden Netty event-loop blocker from the delta-delivery pipeline.
- Implemented **parallel batch metadata validation** using a fixed thread pool sized to available CPU cores, bounding validation time to the slowest single file read instead of scaling linearly with batch size.
- Built **multipart upload support** for object storage with automatic parallel chunking above a 5MB threshold and async offloading, keeping large-file transfers from blocking the request thread.

PROJECTS

AI Learning Assistant

Personal Project

AI-powered learning assistant that answers user queries using generative AI, backed by a Java service layer.

Tech Stack: Java, Spring Boot, Google Gemini API, AWS S3

- **Integrated the Google Gemini API** into a Spring Boot backend to deliver AI-generated, context-aware responses to user queries.
- Used **AWS S3** for storage of application assets, gaining hands-on cloud infrastructure experience.
- Designed a clean REST API layer to **decouple AI provider logic** from core application services, enabling easier future model swaps.

EDUCATION

Andhra University College of Engineering — Visakhapatnam

2018 – 2022

Bachelor of Technology (B.Tech.) in Computer Science and Engineering
